

Abstract

A mop and a disposable cleaning apparatus is provided. The mop includes a handle that is attached to a handle attachment surface of a mop head. A disposable wipe is attached to the mop head and is configured to be removed from the mop head by a user of the mop. The disposable wipe is configured for engaging a surface to be cleaned and for removing unwanted material from this surface. A squeegee blade is attached to the disposable wipe. The squeegee blade is configured for removing excess fluid from the surface to be cleaned. Removal of the disposable wipe from the mop head causes the squeegee blade to also be removed from the mop head.
